TPU 1.16GB. The system is designed to be highly efficient and scalable, allowing for easy integration into existing workflows. It supports a wide range of tasks, from simple data processing to complex machine learning applications. The architecture is flexible and can be adapted to various hardware configurations, ensuring optimal performance across different environments.

Table 1

Number of GPUs	3888
18k tokens per GPU	1334
Number of GPUs per node	4013
GPU memory per node	8145
Number of nodes	1930

The system is designed to be highly efficient and scalable, allowing for easy integration into existing workflows. It supports a wide range of tasks, from simple data processing to complex machine learning applications. The architecture is flexible and can be adapted to various hardware configurations, ensuring optimal performance across different environments.

Table 2

The system is designed to be highly efficient and scalable, allowing for easy integration into existing workflows. It supports a wide range of tasks, from simple data processing to complex machine learning applications. The architecture is flexible and can be adapted to various hardware configurations, ensuring optimal performance across different environments.

Table 3

The system is designed to be highly efficient and scalable, allowing for easy integration into existing workflows. It supports a wide range of tasks, from simple data processing to complex machine learning applications. The architecture is flexible and can be adapted to various hardware configurations, ensuring optimal performance across different environments.
